Acknowledgments

Kristin A. Hansen prepared this report in Population Division, under the general direction of **Phillip A. Salopek,** Chief of the Journey-to-Work and Migration Statistics Branch. **Carol Faber** provided statistical assistance. Overall direction was provided by **Arthur J. Norton,** Assistant Chief (Demographic and Social Statistics Programs), Population Division.

Data collection was conducted by Bureau of the Census interviewers under the overall direction of **Stanley D. Matchett,** Chief of Field Division. Programming support was provided by **Thelma N. Varnach,** and survey operations were coordinated by **Kathleen P. Creighton** of Demographic Surveys Division. Review of statistical testing and appendix B were provided by **Janet Yax** of Survey Methods Division. The staff of Publications Services Division, **Walter C. Odom,** Chief, provided publication planning, design, composition, and printing planning and procurement; **Paula Coupe** edited and coordinated the publication.

Geographical Mobility: March 1986 to March 1987

INTRODUCTION

This report provides detailed statistics on the geographical mobility of Americans. The data were collected in the March 1987 Current Population Survey. Mobility status and moving data were calculated by comparing the locations of each person's current residence and residence 1 year earlier.

This publication includes highlights of some of the important changes that have occurred in the last year, with particular reference to the rates of movement and changes in metropolitan and regional patterns of population movement. The tables used to highlight the text are based on the more detailed tables which follow.

HIGHLIGHTS

- The rate of moving between March 1986 and March 1987, 18.6 (±0.33) percent, did not change from the previous 1-year period. Most people who moved made local moves—11.6 (±0.27) percent of all persons 1 year old and over (62 percent of all movers) moved within the same county.

- The highest moving rates were found among persons in their twenties—34.7 (± 1.42) percent for those 20 to 24 years of age in 1987 and 31.8 (± 1.31) percent for those 25 to 29 years old.

- Blacks had higher overall rates of moving than Whites—19.6 (± 0.98) percent versus 17.8 (± 0.35) percent. Blacks had higher rates of local moving (13.8 ± 0.85 percent) than Whites (11.2 ± 0.29 percent); Whites had higher rates of longer-distance moves (6.6 ± 0.23 percent) than Blacks (5.7 ± 0.57 percent).

- Persons of Hispanic origin had higher overall rates of moving (22.6 ± 1.27 percent) than either non-Hispanic Whites or Blacks, and higher rates of local moving (17.6 ± 1.16 percent) than the other two groups.

- The Northeast had a net loss of migrants—334,000 (±130,000)—to the other regions. The South had a net gain of 279,000 (±193,000) persons, while the West had a net gain of 166,000 (±152,000) people due to migration. The Midwest had nearly equal numbers of inmigrants and outmigrants for the second year in a row.

- Metropolitan areas in the aggregate gained 932,000 (±300,000) persons at the expense of nonmetropolitan areas. However, the central cities of metropolitan areas lost 1,040,000 (±421,000) persons to both nonmetropolitan areas and the suburbs, while the suburbs gained population from both of the other types of areas (1,972,000 ±433,000).

ANNUAL RATES OF MOVING

Although the total population of the United States increased between March 1986 and March 1987, there was no change in the number of movers, either overall or by type of move. (The small differences in the numbers of movers by type of move shown in table A are not statistically significant.) However, differences in the rates of moving by type of move do show some significant changes.

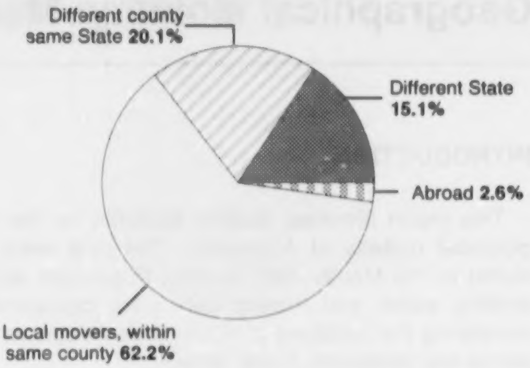
The overall rate at which persons moved in the 1-year period showed no change from the previous year. The annual rate of residential mobility leveled off at 18.6 percent after a period of declining rates during the 1970's and early 1980's and the sharp increase in the mid-1980's. The rate fell from an average of about 20 percent annually during the 1950's and 1960's to a low of 16.6 in 1983. The rate then climbed to 20.2 percent in 1985 before falling again to the current rate.

Local versus long-distance moving. Most people who move make local moves. Optimally, a local move would be defined as a move within a labor market—that is, within an area that would allow commuting to the same job. The extent of the labor market would be specifically defined for each area of residence. Since it is not possible to define and tabulate moves between labor markets using these data, this analysis defines a local move as a move within the same county. Moves from outside the county of current residence are called long-distance moves. Of course, some moves between counties within the same State and even some moves between States may really be local moves, if the counties or States in question are adjacent. Nevertheless, this operational definition of local versus long-distance moving is useful despite such definitional problems.

Generally, local moves are housing adjustments—the purchase of a new home, a change of apartments, etc.—or are made in response to changes in family status or what is commonly termed a "life-cycle change". These life-cycle changes include marriage, divorce, birth of a child, and retirement. Long-distance moves are more frequently undertaken for economic reasons, including corporate transfers, military transfers, new jobs, or looking for work. Others move to attend school or for non-economic reasons such as a desire for a change of climate, proximity to recreational areas, or family reasons.[1]

Table A shows the number of movers by type of move for selected annual periods. Between March 1986 and March 1987, 43,693,000 persons changed residences. Of those, more than 3 out of every 5 (27,196,000) moved within the same county. Of the remaining movers, more moved between counties in the same State (8,762,000) than moved between States or from abroad (6,593,000 and 1,142,000, respectively). While table A shows the percent of the total population that made each type of move, figure 1 graphically displays the proportion of *movers* who made each type of move. Note that as the implied distance increased, the proportion of moves declined. This assumes that movers between counties within the same State usually move shorter distances than persons moving between States and that movers within the same county move, on average, the shortest distances.

Figure 1.
Distribution of Movers, by Type of Move: 1986–87



Most of the change in rates of moving during the last 20 years has been in the rate at which people made local moves. In March 1987, 11.6 percent of the population reported that they lived in a different house or apartment in the same county 1 year earlier. Like the overall rate of moving, the rate of local moving did not decline from the rate found the previous year. However, the 1987 rate of local mobility is significantly lower than

1960-61	36,533	35,535	24,289	11,246	5,493	5,753	3,097	998
PERCENT								
1986-87	18.6	18.1	11.6	6.5	3.7	2.8	1.5	0.5
1985-86	18.6	18.0	11.3	6.7	3.7	3.0	1.6	0.5
1984-85	20.2	19.6	13.1	6.5	3.5	3.0	1.6	0.6
1983-84	17.3	16.8	10.4	6.4	3.6	2.8	1.6	0.5
1982-83	16.6	16.1	10.1	6.0	3.3	2.7	1.4	0.4
1981-82	17.0	16.6	10.3	6.2	3.3	3.0	1.6	0.5
1980-81	17.2	16.6	10.4	6.2	3.4	2.8	1.5	0.6
1970-71	18.7	17.9	11.4	6.5	3.1	3.4	2.0	0.8
1960-61	20.6	20.0	13.7	6.3	3.1	3.2	1.7	0.6

that found in 1985 (although higher than the rate of about 10 percent found during the earlier years of this decade).

The rates at which persons made longer distance moves also did not change between the 1986 and 1987 March CPS surveys. At both dates, 3.7 percent of the population reported moving between counties within the same State, while about 3 percent moved between States. However, the rates of moving between counties within the same State during these two years were slightly higher than the rates for most of the 1-year periods during the early 1980's.

Figure 2 is a line graph showing the annual rates of moving by type of move between 1980 and 1987. Note that the line for local moves mirrors the line for the total rate of moving, while the lines for long distance moves do not. This figure shows that the total annual rate of moving is most influenced by changes in local rates of moving.

CHARACTERISTICS OF MOVERS

Movers differ from nonmovers in many ways. Examination of the demographic, social, and economic characteristics of each group and the differences between movers by type of move can be very illuminating. Selected characteristics of movers by type of move are shown in table B as well as in the detailed tables that follow the text. The following sections of the text examine various characteristics of persons who moved in the previous year.

Age. Moving rates are highly dependent upon age. The highest moving rates were found for persons in their twenties—34.7 percent for those 20 to 24 years of age in 1987 and 31.8 percent for those 25 to 29 years old. Rates of moving declined with increasing age from 18.9 percent for those 30 to 44 years of age to 9 percent for those 45 to 64 years old and to about 5 percent for persons 65 years old and over.

Among young persons, rates of moving began at 26.7 percent for children under the age of 5 and gradually declined with increasing age. The rates for children reflected the average age of their parents; younger children— presumably those with younger parents—had higher rates of moving than older children.

Sex. Men were somewhat more likely to have moved in the previous year than women—18.4 versus 17.8 percent—primarily because they were more likely than women to possess other characteristics associated with high mobility rates. For example, men tend to marry at older ages than women and are, therefore, more likely to be living in nonfamily households. Men are also more likely to be in the military. Each of these groups has a higher rate of moving than other persons. Men had higher rates of moving than women for all types of moves except moves between counties within the same State.

Race. The CPS sample is not large enough to allow comparison of mobility rates for every race, but the differences in rates for Whites and Blacks are compared in table B. Blacks have higher overall rates of moving

Figure 2.
Annual Rates of Moving: 1980–87

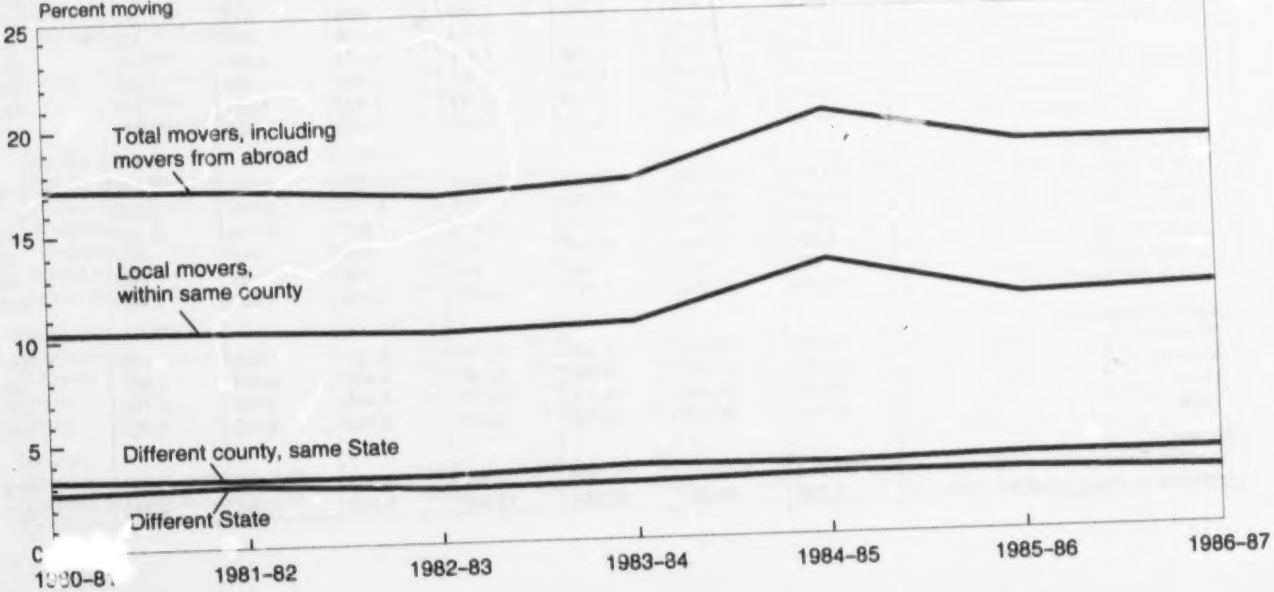

Table B. Selected Characteristics of Persons 1 Year and Older, by Mobility Status and Type of Movement: 1986-87

(Numbers in thousands)

Characteristic	Total, 1 year and older	Non-movers	Different house in the United States					Movers from abroad

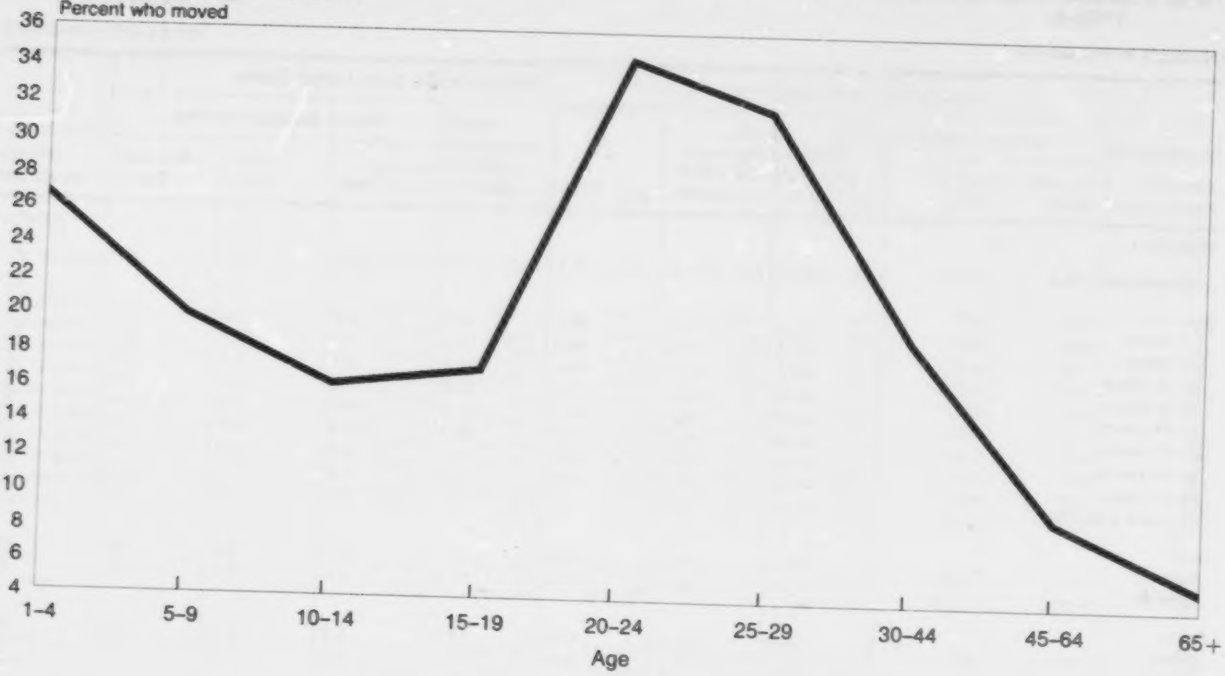
Figure 3.
Movers, by Age: 1986-87



than Whites—19.6 percent versus 17.8 percent, although patterns and implied distances vary considerably.

The higher rates of overall moving by Blacks are accounted for by their high rates of local moving. Between March of 1986 and March of 1987, 13.8 percent of Blacks moved within the same county, while only 11.2 percent of Whites made such moves. On the other hand, Whites had higher rates of longer-distance moves within the United States—6.6 percent as opposed to 5.7 percent. This difference was due to the fact that Whites were more likely than Blacks to move between States and between counties within the same State. There was no statistically significant difference in the rate at which Blacks and Whites moved from abroad.

Hispanic origin. While most persons of Hispanic origin reported their race as White (97 percent), their rates and patterns of moving are very different from those of other Whites as well as from persons reporting their race as Black. Rates of moving for persons of Hispanic origin, non-Hispanic Whites, and non-Hispanic Blacks are shown in table B.

Hispanics had higher total rates of moving than non-Hispanic Whites or Blacks—22.6 percent as compared with 17.4 percent and 19.6 percent, respectively—and much higher rates of local moving (17.6 percent versus 10.5 percent for non-Hispanic Whites and 13.9 percent for Blacks). Because of the high rate of immigration from Mexico and various areas in Central America as well as the movement of persons from Puerto Rico, the rate of moving from abroad was especially high for persons of Hispanic origin (1.7 percent as compared with 0.2 percent for non-Hispanic Whites and 0.4 percent for non-Hispanic Blacks). Both Hispanics and Blacks had lower rates of long-distance moving, either within the same State or between States, than non-Hispanic Whites.

Household relationship. Table B also includes data on mobility by relationship to householder. Persons in families had much lower rates of moving (16.4 percent overall) than persons not living in families. The mobility rate for children in families (16.7 percent) was a little higher than for either householders (15.9 percent) or their spouses (15.0 percent). Other relatives (for example, parents, brothers and sisters of the householder or spouse) had the highest rate of moving of all family members (25.3 percent).

Nonfamily householders (persons living alone or with nonrelatives) have fairly high rates of moving (22.1 percent), although not as high as rates for other relatives in family households. However, nearly half of nonrelatives, persons living with a nonfamily householder or an unrelated person living in a family household, moved in the previous year (46.7 percent). These nonrelatives include unrelated roommates or partners; foster children; roomers, boarders, or lodgers; and employees.

Education. The relationship between education (measured in the CPS as years of school completed) and residential mobility is more complicated than the relationship between residential mobility and many other characteristics. Table B includes mobility rates by years of school completed for persons 25 years old and over. Persons who completed exactly 4 years of college had the highest rate of moving (21.8 percent), followed by those who attended college for less than 4 years (19.6 percent). Persons with more than 4 years of college moved at about the same rate as persons with only a high school education (17.0 percent for high school graduates, 18.5 percent for high school dropouts).

Persons 25 years old and over with only an elementary school education had the lowest rates of moving between March 1986 and March 1987 (11.8 percent), due in part to the fact that they were most likely to be elderly. According to table C, the median age of persons with only an elementary school education is 64.1 years as compared with 51.2 years for persons with at least some high school and 43.6 years for high school graduates who did not go on to attend college. In March 1987, the median age of persons who had attended college was about 40.

Labor force status. Rates of moving also vary by labor force status. While it would be desirable to know each person's labor force status at the time of the move, this information is not available. Therefore, data are limited to information on each person's labor force status after the move, at the time of the survey, as shown in table B.

Members of the Armed Forces continued to have the highest mobility rates—not only for long-distance moves between States and from abroad—but also for short-distance, local moves within the same county (with the possible exception of unemployed local movers). In March 1987, 1 out of every 4 military respondents reported that they lived in a different State or were abroad one year earlier (18.4 and 7.7 percent, respectively). Combined with those who had moved within the same county (17.5 percent) and those who had moved from a different county in the same State (4.1 percent), nearly half of all military personnel surveyed (47.9 percent) were movers. The Current Population Survey only includes those members of the Armed Forces living off base or in housing units on base with their families. Military personnel who lived in barracks or other group quarters may have had even higher rates of moving than those surveyed.

Rates of moving for civilians vary by labor force status. Persons who were unemployed during the survey week had high rates of moving, but their moves were typically local. And while the mobility rates among the unemployed were quite a bit higher than for employed persons, they were much lower than the rate at which military personnel moved. About 27.7 percent of the unemployed moved within the United States between March 1986 and March 1987; 17.0 percent moved within the same county.

Employed persons moved at a rate only a little higher than the national average for all persons (19.7 percent). Like most movers, the majority of their moves were within the same county (12.6 percent).

The lowest rate of moving was found among persons not in the labor force— only 12.0 percent of these persons had moved in the previous year. Persons 16 years old and over who were not in the labor force consist mainly of retired persons, students, housewives, and others who do only volunteer work or their own housework. Self-employed persons who work at home are considered employed.

Tenure. One of the most important indicators of a person having moved in the previous year is household tenure. Residential mobility is much more common for renters than for homeowners and their families. Like labor force status, it would be desirable to know tenure at the time of the move; that is, whether or not the previous housing unit was owned or rented. Since that information is not collected in the Current Population Survey, this analysis is limited to tenure at the time of the survey; that is, after the move. These data are shown in table B.

People living in owner-occupied housing units in March 1987 were much less likely to have moved in the preceding year than people living in rental units at the

Table C. **Median Age, by Years of School Completed: 1986-87**

(Numbers in thousands)

Age	Elementary, 0-8 years	High school		College		
		1-3 years	4 years	1-3 years	4 years	5 or more years
Total 25 years and over	18,942	17,417	57,669	25,479	17,169	12,469
25 to 29 years	896	2,139	9,177	4,656	3,411	1,357
30 to 34 years	854	1,856	8,362	4,501	3,451	1,977
35 to 44 years	1,925	2,818	13,140	6,836	4,704	4,208
45 to 64 years	6,081	6,130	18,382	6,561	3,965	3,783
65 years and over	9,186	4,474	8,608	2,925	1,638	1,144
Median age	64.1	51.2	43.6	40.2	38.7	41.9

time of the survey. Only 10.0 percent of the respondents living in housing units owned by someone in the household had moved in the previous year as compared with 35.0 percent of the renters. Of those homeowners who had moved, most had made local moves; 6.2 percent of all homeowners moved within the same county while only 3.8 percent moved from a different county in the United States. Renters also made many more local moves than long-distance moves; 23.0 percent had moved within the same county compared with only 12.1 percent who had moved between counties. While 1.1 percent of renters lived abroad the previous year, only 0.2 percent of those living in owner-occupied units had moved from abroad.

Despite the fact that many more people live in owner-occupied homes than in rental units, movers are more likely to be renters than homeowners. In March 1987, the CPS found that 159,355,000 persons (68 percent) were living in owner-occupied units; that left 75,734,000 or 32 percent of the total population living in rental units. However, only 15,899,000 (37 percent) of the movers were homeowners while 26,652,000 or 63 percent were renters. Movers from abroad were also much more likely to be renters than owners. Only 28 percent of those who lived abroad 1 year earlier were living in owner-occupied units in March 1987; 72 percent were living in rental units.

METROPOLITAN MOBILITY PATTERNS

Residence in 1986 can be compared with residence at the survey date to determine whether or not each person lived in the same metropolitan statistical area (MSA) one year earlier. Moves can be variously categorized as moves within or between MSA's; into MSA's from nonmetropolitan parts of the country and vice versa; or within or between cities and suburbs. In this text, the "suburbs" are synonymous with the "remainder of the MSA" shown in the detailed tables; "metropolitan areas" and "inside MSA's" are also synonymous as are "nonmetropolitan areas" and "outside MSA's."

The data on inmigration and net migration for MSA's, their component parts, and nonmetropolitan areas discussed below and shown in the text tables exclude the effects of movement into these areas from abroad; the numbers of movers from abroad are included in the detailed tables. The net migration figures that result only from internal migration should not be confused with population change. Net internal migration is only one component of population change; the other components include immigration from abroad, emigration from the United States, the net effect of births and deaths in the area, and the movement of U.S. citizens into and out of the country.

The industrial revolution spurred the movement of people off the farm and out of rural places into the cities.[2] This movement of the population from nonmetropolitan to metropolitan places has been measured by successive censuses since the initial designation of metropolitan areas in the early 1950's. Earlier data on population growth indicated the redistribution of people from rural areas to the cities.[3] This pattern of urbanization is seen throughout the world in developing countries and is a primary component of traditional migration theory.

During the 1970's the United States saw a reversal[4] of this classic and expected trend toward increased urbanization. That decade was characterized by a period of net outmigration from metropolitan areas to the nonmetropolitan parts of the country. Some speculation arose that this was only continuing suburbanization of counties adjacent to existing metropolitan areas, and that redefinition of standard metropolitan statistical areas (SMSA's) after the 1980 census would see most of these counties redefined as metropolitan. Investigation of the nonmetropolitan counties which experienced growth during the late 1970's[5] indicated that five-eighths of the movers were going to counties adjacent to metropolitan areas. And while migrants were not generally moving to farms (the farm population continued to decline), the remaining three-eighths were indeed moving to areas not adjacent to SMSA's. These counties were often either major recreational areas, sites of large universities or other major institutions or military installations, or were popular retirement areas. Data from the 1980 census using the updated SMSA definitions showed a net loss for metropolitan areas for the 1975-80 period.

Since 1980, metropolitan areas (even using the old, pre-1980 definitions) have reverted to the former pattern of net inmigration as the result of internal migration. Redefinition of metropolitan areas, now called metropolitan statistical areas or MSA's, occurred in 1983. The 1986 Current Population Report on geographical mobility (P-20, No. 425) was the first in this series of reports to display data using the new metropolitan area definitions. As expected, those data showed a continuation of net inmigration for metropolitan areas. Individual metropolitan areas (in both the 1970's and now) may have different patterns of movement than all metropolitan areas combined. For example, 1980 census data reveal that some individual SMSA's experienced net inmigration due to internal migration between 1975 and 1980, while all areas combined exhibited net outmigration.[6]

Moves between MSA's and nonmetropolitan areas. In the year between March 1986 and March 1987, metropolitan areas continued to gain population at the expense of the nonmetropolitan parts of the country. The movement between cities, suburbs and nonmetropolitan areas during this year was substantial. (Table D shows inmigrants, outmigrants, and net migration for MSA's and nonmetropolitan areas.) Although the net gain for MSA's was nearly a million, over 4 million people changed their type of residence—2,686,000 moved from nonmetropolitan areas to metropolitan areas, while 1,754,000 persons made the opposite move.

The net gain of internal migrants for metropolitan areas as a whole occurred because the suburbs' net gains were large enough to more than compensate for the net losses suffered by the central cities. During the period between March 1986 and March 1987, the central cities of MSA's lost 1,040,000 more residents than they gained from the suburbs and the nonmetropolitan parts of the country, while the suburbs had a net gain of 1,972,000 residents from the central cities and outside MSA's.

Table E shows the flows of persons between cities, suburbs, and nonmetropolitan areas. Note that persons leaving MSA's for nonmetropolitan areas were about equally likely to have previously lived in central cities as in suburbs (828,000 and 926,000 persons, respectively). Movers from the nonmetropolitan parts of the country to MSA's were somewhat more likely to choose a suburban destination than to move to a central city—3 out of every 5 moved to the suburbs (1,597,000 persons), while only 2 out of 5 moved to central cities (1,089,000 persons).

Movement within and between cities and suburbs. In addition to the 4,440,000 persons who changed their residence from nonmetropolitan to metropolitan (or vice versa), an additional 8,289,000 persons moved between cities and suburbs during the year. The combination of all these moves resulted in the nearly one million net loss for central cities and the nearly 2 million net gain for the suburbs noted above and shown in table D. The magnitude of those net gains and losses, however, seems small in comparison to the 12,729,000 moves that generated them (see table E). Since the majority of all moves took place within metropolitan areas, a closer look at these moves is warranted.

Table D. **Inmigrants, Outmigrants, and Net Migration for Central Cities, Suburbs, and Nonmetropolitan Areas: 1986-87**

(Numbers in thousands)

Residence in 1987	Inmigrants	Outmigrants	Net migration
Inside MSA's	2,686	1,754	+932
Central cities	4,583	5,623	−1040
Suburbs	6,392	4,420	+1972
Outside MSA's	1,754	2,686	−932

Table E. **Movers Within and Between Central Cities, Suburbs, and Nonmetropolitan Areas: 1986-87**

(Numbers in thousands)

Residence in 1988	Movers from inside MSA's			Movers from outside MSA's
	Total	Central cities	Suburbs	
Inside MSA's	30,843	15,401	15,442	2,686
Central cities	14,100	10,606	3,494	1,089
Suburbs	16,743	4,795	11,948	1,597
Outside MSA's	1,754	828	926	6,920

Most of the central city residents in 1987 who had moved within the United States during the previous year were not newly arrived in the central city—8,617,000 had moved from another residence in the same city; 1,989,000 had moved from a central city of a different MSA; and 3,494,000 were former suburbanites. Only 1,089,000 had moved from nonmetropolitan areas. (These data are shown in table 1.)

One of the most common patterns in residential mobility and population redistribution in this century has been the suburbanization of America. City planners and inner-city mayors constantly complain about the loss of tax base due to middle class flight to the suburbs. While individual cities and their suburbs may not display this pattern, generally central cities lose more residents due to internal migration within an MSA than they gain from other jurisdictions.

Most of the people who left the central cities of MSA's stayed in metropolitan areas. During the year preceding the 1987 survey, 5,623,000 persons left the central cities of MSA's—the vast majority of them moved to the suburbs (85.3 percent) rather than to nonmetropolitan locations (14.7 percent).

A similar picture can be painted of suburban movers. Like central city dwellers, movers living in suburbs in 1987 were nearly twice as likely to have moved from another suburban residence (11,948,000 persons) as from either a central city (4,795,000 persons) or a nonmetropolitan location (1,597,000 persons). Three-quarters of the persons moving from one suburban residence to another moved within the same MSA (8,877,000 persons); moves from the suburbs of one MSA to another were much less common (3,071,000 persons).

---

[6] U.S. Bureau of the Census, 1980 Census of Population and Housing, *Geographical Mobility for Metropolitan Areas*, PC80-2-2C, U.S. Government Printing Office, Washington, DC, 1985.

As noted above, the suburbs gained three-quarters of their inmigrants (4,795,000 persons) from the central cities. Only 1,597,000 came from nonmetropolitan areas. Persons leaving the suburbs were more likely to move to central cities (3,494,000 persons) than to nonmetropolitan parts of the country (926,000 persons).

These data show that when we move, we are most likely to stay in the same type of area—suburbanites are most likely to move to another suburban residence and city dwellers are most likely to remain city dwellers. Nonmetropolitan residents are also most likely to remain nonmetropolitan residents when they move—while 2,696,000 moved to cities or suburbs between 1986 and 1987, another 6,920,000 persons moved from one nonmetropolitan residence to another.

REGIONAL PATTERNS OF MOVING

Regional migration patterns are important indicators of population redistribution. Historically, the population of this country has shifted to the West. Between the Civil War and up through the 1950's, there was a secondary shift from the South to the industrialized cities in the North. Beginning in the 1960's, however, the South began to have a net inmigration of persons from the other regions.[7] By the late 1970's, the previous 100 years of net outmigration from the South by Blacks had also reversed.

The causes of this turnaround[8] have been attributed to many changes in the economy and life-styles in this country. The relocation of industry out of the "Rustbelt" into the South because of tax incentives and cheaper, non-Unionized labor; the rise of light industry, such as electronics, that depend on trucking rather than rail transportation; the spread of home air conditioning; the leveling of regional differences in standards of living, educational opportunities, and cultural amenities; and the success of the civil rights movement have all been offered as contributing factors.

The data collected in this survey provide for the disaggregation of movers by their region of current residence and their region of residence prior to the move. Data of this sort can be used to determine whether a change in the net migration for a region is due to a change in the origin or destination of interregional migrants or to a change in the relative size of the flows into or out of a region.

Inmigrants, outmigrants, and net migration for regions are shown in table F. These numbers reflect persons who reported that they moved from one region to another during the stated periods. Persons moving into a region from abroad (or for that matter persons who left the United States during the period) are not included in this discussion or in the text table displaying data for the regions.

Table F. **Annual Inmigration, Outmigration, and Net Migration for Regions: 1980-87**

(Numbers in thousands)

Period	Northeast	Midwest	South	West
1986-87:

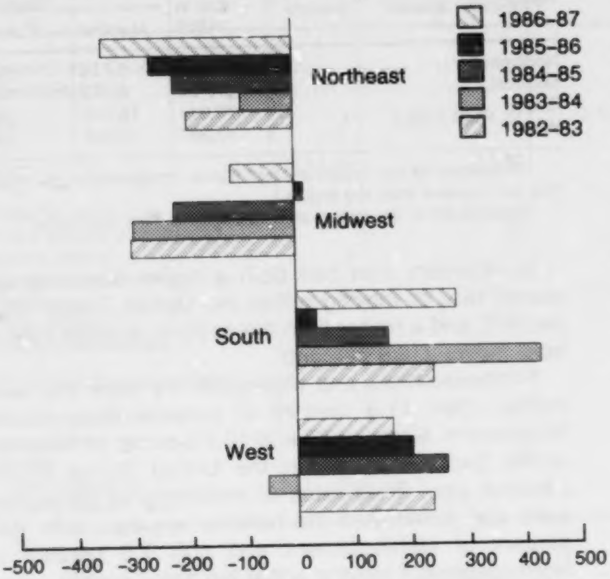
Figure 4. **Net Migration, for Regions: 1980-87**



Net migration for regions. Between March 1986 and March 1987, the Northeast had a net loss of 334,000 migrants to the other regions; the South had a net gain of 279,000 migrants; and the West had a net gain of 166,000 people due to migration. The net loss for the Midwest shown in table G (-111,000 ± 168,000) is not statistically significant—because of sampling variability the "true" net for the Midwest could range from -279,000 to +58,000 persons.

The South also had net inmigration of Blacks between 1986 and 1987. (The numbers of inmigrants, outmigrants, and net migration by race are shown in table G.) Black inmigrants to the South out numbered Black outmigrants by 148,000 (±70,000). The Northeast also had a significant net outmigration of 100,000 (±41,000) Blacks. The other two regions had nearly equal numbers of Black inmigrants and outmigrants. For Whites, only the net loss of 241,000 (±120,000) migrants from the Northeast and the net gain of 170,000 (±143,000) migrants to the West were statistically significant. The Midwest and the South had nearly equal numbers of in and outmigrants.

In the previous 1-year period (between March 1985 and March 1986) the patterns for the Northeast, the

X Not applicable.

Midwest, and the West were the same as for the current year. However, during that period the South did not have significantly different numbers of inmigrants and outmigrants.

The data in table F also show that during most years of this decade the Northeast and the Midwest most often had net losses of migrants, while the South and the West usually had net inmigration. These data for the last 5 years are shown graphically in figure 4.

Flows between regions. Looking at the origin and destination figures in table H for the two most recent periods, the only flow between the four regions that significantly changed was the number of persons moving from the South to the Midwest—a decrease of 214,000 migrants.[9] The number of movers in each of the other flows did not show any significant change between the two periods.

Looking at the total number of inmigrants and outmigrants by region, the number of outmigrants from the South declined by 225,000 between the 1985-86 and 1986-87 periods. The total number of inmigrants to the South did not show any significant change between the two periods. Nor was there any significant change in the numbers of inmigrants or outmigrants for any of the other three regions.

Rates of moving by region of residence. Rates of moving vary by region of residence. These data are shown at the bottom of table B. We would expect that the South and the West would have the highest percent of persons living there that had moved in the previous year since those two regions had net gains of interregional migrants. However, persons living in those two regions also had higher rates of intra-regional movement than persons living in the Northeast and the Midwest in 1987. In other words, people living in the South or the West are more likely to move than persons living in the Northeast or Midwest.

Persons living in the West had the highest overall movement with 22.4 percent of the population reporting that they had lived elsewhere in the United States 1 year earlier, compared with 18.1 percent for the United States as a whole. Westerners also made the most local moves—14.5 percent had moved within the same county, compared with 11.6 percent nationwide.

Table I. **Mobility Rates, for Regions: 1986-87**

Region	Population in [1]1986	[2]Movers	
		Number	Percent
Northeast	48,985	6,175	12.6
Midwest	57,730	9,772	16.9
South	79,944	16,040	20.1
West	47,287	10,565	22.3

[1] Population of the region in 1987 minus inmigrants to the region plus outmigrants from the region.

[2] Movers within the region plus outmigrants from the region.

Southerners also had both a higher than average overall rate of moving within the United States (20.3 percent) and a higher than the national average rate of local moves (12.9 percent).

Northeasterners and Midwesterners were the least mobile. Only 11.9 percent of persons living in the Northeast in March 1987 and 16.7 percent of Midwesterners had moved within the United States in the previous year. Their rates of intra-regional movement were also lower than the national average, with 10.7 percent of Midwesterners and only 7.6 percent of Northeasterners moving within the same county.

Only the West had a particularly high rate of movement from abroad—1.0 percent as compared with 0.3-0.4 percent for each of the other regions.

It can be argued that the Northeast and Midwest had lower rates of moving because more of their residents moved out to the other two regions. However, when the 1986 population at risk of moving is reconstructed and the rates of moving are calculated for persons by region of residence in 1986, the Northeast and the Midwest still had lower mobility rates than the other two regions. (These data are shown in table I.) Using these at risk rates, only 12.6 percent of Northeasterners and 16.9 percent of Midwesterners moved in the year between March 1986 and March 1987. At the same time the at risk rates for Southerners and Westerners were 20.1 percent and 22.3 percent, respectively.

Appendix A. Definitions and Explanations

DEFINITIONS

Mobility status. The population was classified according to mobility status on the basis of a comparison between the place of residence of each individual at the time of the March 1987 survey and the place of residence 1 year earlier. Nonmovers are all persons who were living in the same house at the end of the migration period (March 1987) and the beginning of the migration period (March 1986). Movers are all persons who were living in a different house at the end of the period than at the beginning. Movers are further classified as to whether they were living in the same or a different county, State, or region, or were movers from abroad. Movers are also categorized by whether they moved within or between central cities, suburbs, and nonmetropolitan areas of the United States.

Metropolitan-nonmetropolitan residence. The population residing in metropolitan areas (MSAs) constitutes the metropolitan population. MSAs are defined by the Office of Management and Budget for use in the presentation of statistics by agencies of the Federal Government. An MSA is a geographical area consisting of a large population nucleus, together with adjacent communities which have a high degree of economic and social integration with that nucleus. The definitions specify a boundary around each large city so as to include most or all its suburbs. Entire counties form the MSA building blocks, except in New England where cities and towns are used. The former term SMSA was changed to MSA in 1983.

An area qualifies for recognition as an MSA if (1) it includes a city of at least 50,000 population, or (2) it includes a Census Bureau-defined urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 (75,000 in New England). In addition to the county containing the main city or urbanized area, an MSA may include other counties having strong commuting ties to the central county. If specified conditions are met, certain large MSA's are designated as consolidated MSA's (CMSA's) and divided into component primary MSA's (PMSA's).

The largest city in each MSA is always designated a central city. There may be additional central cities if specified requirements, designed to identify places of central character within the MSA, are met. Although the largest central cities are generally included in the title of the MSA, there may be central cities that are not part of the title. The balance of the MSA outside the central city or cities often is regarded as equivalent to the "suburbs."

In this report, the terms "metropolitan" and "inside MSA's" are synonymous, as are the terms "nonmetropolitan" and "outside MSA's." The "balance of the MSA" refers to the remainder of the MSA outside the central city or cities, and is synonymous with the term "suburbs." The "size of the MSA" refers to the number of persons living in the MSA at the time of the 1980 census.

Geographic regions. The four major regions of the United States for which data are presented in this report represent groups of States as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

Midwest: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Age. This classification is based on the age of the person at the survey date.

Race. The population is divided into three groups on the basis of race: White, Black, and other races. The last category includes American Indians, Asians, and any other race except White and Black. In this report, other races are included in the totals but not shown separately.

Hispanic origin. Persons of Hispanic origin were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Hispanic persons, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin. Persons of Hispanic origin may be of any race.

Marital status. The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the survey. Married persons are further divided into "married, spouse present" and "married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily residing elsewhere.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants. A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. Persons living in rooming houses, college dormitories, or other group quarters are not included in the count as households.

Householder. The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded. Prior to 1980, the husband was always considered the household head (householder) in married-couple households. The number of householders is equal to the number of households. Also, the number of family householders is equal to the number of families.

Nonfamily householder. A nonfamily householder (formerly called a primary individual) is a person maintaining a household while living alone or with nonrelatives only.

Family. A family is a group of two or more persons (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons are considered as members of one family.

Married couple. A married couple, as defined for census purposes, is a husband and wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "married-couple" before the term "household" or "family" indicates that the household or family is maintained by a husband and wife.

Related persons and family members. In the classification of households by number of related persons, the person or couple who maintains the household (or housing unit) and all persons in the household related to them are included. In the classification of families by number of family members, all persons in the family are included. The number of family members is the same as the size of the family.

Own children. "Own children" in a family are sons and daughters, including step children and adopted children, of the family householder. The count of own children under 18 years old is limited to single (never married) children.

Years of school completed. Data on years of school completed were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not the grade was finished. The questions on educational attainment apply only to schooling that may advance a person toward an elementary school certificate or high school diploma, or a college, university, or professional school degree.

Labor force status. Persons are classified as "in the labor force" if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" comprises all civilians classified as employed or unemployed. All civilians who are not classified as employed or unemployed are defined as "not in the labor force." Employed persons include all civilians who did any work at all during the specified week as paid employees or in their own business or professional practice, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and all those who were not working but who had a job or business from which they were temporarily absent, whether or not they were paid by their employers for the time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work in or around their own house or volunteer work. Unemployed persons are those civilians who had no employment but were available for work and had engaged in any specific jobseeking activity within the last 4 weeks or were on a union or professional register, were waiting to be called back to a job from which they had been laid off, or were waiting to report to a new job within 30 days.

Occupation. The data on occupation of employed persons refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week. The occupation groupings used here are mainly the major groups used in the 1980 census. The composition of these groups is shown in the 1980 Census of Population, PC80-1-C Series, *General Social and Economic Characteristics*.

Income. For each person 15 years old and over, questions were asked on the amount of money income received in the preceding calendar year. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of the survey. However, family income includes amounts reported by related persons who did not reside with the family during the income year but were members of the family on the survey date.

Poverty status. Families and unrelated individuals are classified as being above or below the poverty level, using the poverty index adopted by a Federal Interagency Committee in 1969. This index provides a range of income cutoffs or "poverty thresholds" adjusted to take into account such factors as family size, sex and age of the family householder, and the number of children. These income cutoffs are updated every year to reflect the changes in the Consumer Price Index. The average poverty threshold for a family of four was $11,203 in 1986.

Public assistance. Families are classified as "with public assistance" if one or more persons in the family received any public assistance or welfare payments in the preceding year. "Public assistance," as defined in this report, does not include Supplemental Security Income (SSI) payments.

Mean. The mean (average) number of persons per family is the value obtained by dividing the number of persons having the characteristics under consideration by the appropriate number of families. The mean number of own children is the number of own children of the age under consideration divided by the total number of families with own children.

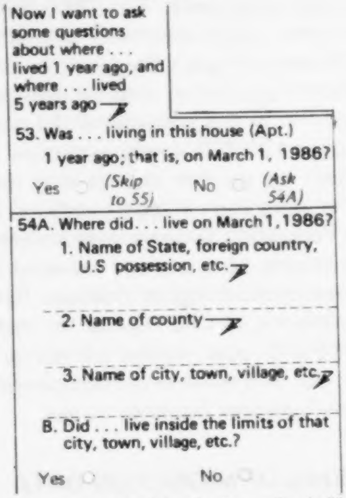
Median. The median is the value which divides the distribution into two equal parts, one-half of the cases falling below this value and one-half of the cases exceeding this value. It is presented in connection with the data on age, years of school completed, and income.

Rounding. Detailed data in the tables may not agree with the totals because of independent rounding. Furthermore, calculations such as means, medians, and percentages are based on the unrounded figures and therefore may not agree with those derived from rounded figures in the table.

Symbols. A dash (-) represents zero or rounds to zero and the symbol "B" means that the base is less than 75,000.

MIGRATION UNIVERSE

The mobility data in this report are derived from the answers to questions on residence 1 year before the survey date and the geographical location of the respondent's current residence. A facsimile of the questions are shown below. These questions were asked for all members of the survey household who were 15 years old and over on the survey date. Residence 1 year earlier for persons under 15 years old was allocated based on the responses of their parents or other members of the household. (See the following section, "Allocations of Migration Data," for a further discussion of the allocation of mobility data for children and other persons for whom no response or only partial responses to the mobility questions were given.)



Now I want to ask some questions about where . . . lived 1 year ago, and where . . . lived 5 years ago

53. Was . . . living in this house (Apt.) 1 year ago; that is, on March 1, 1986?

Yes ○ *(Skip to 55)* No ○ *(Ask 54A)*

54A. Where did . . . live on March 1, 1986?

1. Name of State, foreign country, U.S possession, etc.
2. Name of county
3. Name of city, town, village, etc.

B. Did . . . live inside the limits of that city, town, village, etc.?

Yes ○ No ○

The universe sampled includes all civilian noninstitutional households and members of the Armed Forces living off base or with their families on base. (For a more detailed discussion of the sample selection and limitations of the sample and survey design, see "Source and Reliability of the Estimates".)

In July 1985, the Current Population Survey began using the metropolitan statistical area definitions announced by the Office of Management and Budget on June 30, 1984. Figures published from the CPS in the early 1980's and throughout most of the 1970's referred to metropolitan areas as defined on the basis of the 1970 census. Since there are important differences in the population classified as metropolitan using the 1970 and 1984 definitions, comparisons should be avoided.

The new CPS metropolitan estimates have consistently been higher than independent estimates of the metropolitan population prepared by the Census Bureau; the new CPS nonmetropolitan estimates have been lower than the independent estimates. For example, between July 1985 and August 1986 the magnitude of the monthly differences varied from 900,000 to 2.5 million persons, so that the proportion of the population living in metropolitan areas according to the CPS has ranged from 0.4 to 1.0 percentage points higher than the independent estimate. The difference in level between the two sets of estimates is partially attributable to the basic CPS sample design, which, because of sampling variability, includes an oversample of metropolitan households and an undersample of nonmetropolitan households. The monthly variations result from the exit an entrance of rotation groups, each with slightly different metropolitan-nonmetropolitan proportions, into the sample. The apparent overestimation of metropolitan and underestimation of nonmetropolitan population in the CPS relative to the Bureau's independent estimates should be taken into account when using the data.

Undocumented immigrants. The 1980 census counted about two million undocumented immigrants according to Census Bureau estimates. Beginning in January 1986, the independent population controls included an allowance for growth in the undocumented population for every year since 1980. This methodological change was partially offset by another change that increased the allowance for emigration of legal residents. Data shown for Current Population Surveys with controls based on pre-1986 methods have not been revised to take into account these methodological changes. Consequently, direct comparisons of CPS figures for months before January 1986 with later months will not be consistent. Series P-25, No. 985 reviews the postcensal population estimates methodology currently in use.

ALLOCATIONS OF MIGRATION DATA

In the March Current Population Surveys, complete mobility information is usually not reported for about 6 percent of all persons 15 years old and over; the mobility questions were not asked for any persons under 15 years of age. In these cases, persons missing mobility data are assigned the mobility status and previous residence obtained for other family members or allocated using the data for another sample person who did respond to the questions. The mobility status and previous residence allocated to a nonrespondent is that obtained for another person with similar demographic characteristics who has been selected systematically in the order in which individual records are processed. Characteristics used in these allocations (when assignment of data for other family members is not possible) are age, race, years of school completed, and metropolitan status and State of current residence. State of previous residence is used instead of State of current residence is the individual being allocated data reported state of previous residence but not city or county.

The same edit and allocation procedures have been used in each Current Population Survey since 1975. The edit and allocation procedures used in the 1970 and 1980 censuses are very similar although additional matching characteristics are used that are not included on the CPS questionnaire.

RELATED REPORTS AND DATA PRODUCTS

Statistics on the geographical mobility of the population of the United States have been collected annually in the Current Population Survey since 1948. Migration data from these annual surveys are published in Series P-20 of the Current Population Reports. The most recent report was Series P-20, No. 425, *Geographical Mobility: March 1985 to March 1986.*

Microdata computer files are also available for each of the Current Population Survey's Annual Demographic Files (March Supplement) beginning with 1968. The 1987 tape is available from Data User Services Division, Customer Services (Tapes), U.S. Bureau of the Census, Washington, D.C. 20233; telephone (301) 763-4100. Technical documentation comes with the tape or is available separately from the Data Access and Use Staff of the Data User Services Division, at the same address, telephone (301) 763-2074, and should be cited as Current Population Survey: March 1987: Technical Documentation.

Geographical mobility researchers may wish to utilize data from two other current surveys conducted by the Bureau of the Census. The American Housing Survey (formerly Annual Housing Survey), conducted since 1973, contains a broad array of data pertaining to residential mobility for the nation as a whole and for selected metropolitan areas. The Survey of Income and Program Participation, begun in 1984, is a series of panel surveys, initiated annually, in which national samples of individuals are reinterviewed every 4 months for a period of 2 1/2 years. Details concerning data products from both of these current surveys are available in the Census Catalog and Guide: 1985 (U.S. Bureau of the Census, 1985).

The Bureau of the Census also publishes annual State population estimates, which contain net migration estimates for States, and population projections that employ a variety of migration assumptions. Recent reports including net migration for States include Current Population Reports, Series P-25, No. 998, *State Population and Household Estimates to 1985, with Age and Components of Change.* National population projections for the next century are available in

Series P-25, No. 952, *Projections of the Population of the United States, by Age, Sex, and Race: 1983 to 2080.* Projections for individual States that incorporate net migration assumptions based on interstate movement during the 1970-80 period are available in Series P-25, No. 937, *Provisional Projections of the Population of States, by Age and Sex: 1980 to 2000.* Projections for individual States that incorporate migration assumptions based on annual interstate movement between 1976 and 1987 derived from IRS data are available in Series P-25, No. 1017, *Projections of the Population of States, by Age, Sex, and Race: 1988 to 2010.*

Various forms of geographical mobility data are also collected as part of the decennial census. Each decennial census since 1850 has collected information on place of birth and current location of residence. In addition, the decennial censuses of 1940, 1960, 1970, and 1980 asked where individuals resided 5 years previously; i.e., in 1935, 1955, 1965, and 1975. The 1950 census asked where individuals resided in 1949. Tabulations and microdata computer files are available from each of these censuses.

Tabulations from the 1980 Census of Population are available by States in *General Social and Economic Characteristics,* PC80-1-C, and in *Detailed Population Characteristics,* PC80-1-D; in three Supplementary Reports: *State of Residence in 1975 by State of Residence in 1980,* PC80-S1-9; *Residence in 1975 for States by Age, Sex, Race, and Spanish Origin,* PC80-S1-16; and *Gross Migration for Counties: 1975 to 1980,* PC80-S1-17; and in two Volume 2, Subject Reports: *Geographical Mobility for States and the Nation,* PC80-2-2A and *Geographical Mobility for Metropolitan Areas,* PC80-2-2C.

Appendix B. Source and Reliability of Estimates

SOURCE OF DATA

Most estimates in this report come from data obtained in March 1987 in the Current Population Survey (CPS). Some estimates come from data obtained from the CPS in earlier years.

Basic CPS. Each month CPS collects labor force data for the civilian noninstitutional population. Interviewers ask questions concerning labor force participation about each member 15 years old and older in every sample household.

The present CPS sample was selected from 1980 decennial census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to account for new residential construction. It is located in 729 areas comprising 1,973 counties, independent cities, and minor civil divisions. About 59,500 occupied households are eligible for interview every month. Interviewers are unable to obtain interviews at about 2,500 of these units because the occupants are not home after repeated calls or are unavailable for some other reason.

Since the introduction of the CPS, the Bureau of the Census has redesigned the CPS sample several times to improve the quality and reliability of the data and to satisfy changing data needs. The most recent changes were completely implemented by July 1985.

The following table summarizes changes in the CPS designs for the years for which data appear in this report.

Description of the Current Population Survey

Time period	Number of sample areas	Housing units eligible[1]	
		Interviewed	Not interviewed
1986-87	729	57,000	2,500
1985	[2] 629/729	57,000	2,500
1982-84	629	58,000	2,500
1980-81	629	65,500	3,000
1977-79	614	55,000	3,000
1973-76	461	46,500	2,500
1972	449	45,000	2,000
1967-71	449	48,500	2,000
1963-66	357	33,500	1,500
1960-62	333	33,500	1,500

[1] Since March 1972, approximately 2,500 Hispanic households have been added from the previous November sample. However, they are not included in this table. [2] The CPS was redesigned following the 1980 decennial census of Population and Housing. During phase-in of the new design with the old, housing units from both designs were in the sample.

March supplement. In addition to the basic CPS questions, interviewers asked supplementary questions about place of residence one year ago (March 1, 1986).

In order to obtain more reliable data for the Hispanic population, the March CPS sample was increased by about 2,500 eligible housing units, interviewed the previous November, that contained at least one sample person of Hispanic origin. In addition, the sample included persons in the Armed Forces living off post or with their families on post.

Estimation procedure. This survey's estimation procedure inflates weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, sex, race and Hispanic/non-Hispanic categories. The independent estimates were based on statistics from decennial censuses of population; statistics on births, deaths, immigration and emigration; and statistics on the size of the Armed Forces. The independent population estimates used for 1980 (March 1981 CPS) to present were based on updates to controls established by the 1980 decennial census. Data previous to 1980 were based on independent population estimates from the most recent decennial census. For more details on the change in independent estimates, see the section titled "Introduction of 1980 Census Population Controls" in an earlier report (Series P-60, No. 133). The estimation procedure for the March supplement included a further adjustment so husband and wife of a household received the same weight.

The estimates in this report for 1983 through 1987 also employ a revised survey weighting procedure for persons of Hispanic origin. In previous years, weighted sample results were inflated to independent estimates of the noninstitutional population by age, sex, and race. There was no specific control of the survey estimates for the Hispanic population. Since then, the Bureau of the Census developed independent population controls for the Hispanic population by sex and detailed age groups. Revised weighting procedures incorporate these new controls. The independent population estimates include some, but not all, illegal immigrants.

RELIABILITY OF ESTIMATES

Since the CPS estimates come from a sample, they may differ from figures from a complete census using the same questionnaires, instructions, and enumerators. A sample survey estimate has two possible types of error: sampling and nonsampling. The accuracy of an estimate depends on both types of error, but the full extent of the nonsampling error is unknown. Consequently, one should be particularly careful when interpreting results based on a relatively small number of cases or on small differences between estimates. The standard errors for CPS estimates primarily indicate the magnitude of sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure systematic biases in the data. (Bias is the average over all possible samples of the difference between the sample estimates and the desired value.)

Nonsampling variability. Nonsampling errors can be attributed to many sources. These sources include inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, respondents' inability or unwillingness to provide correct information or to recall information, errors made in data collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

CPS undercoverage results from missed housing units and missed persons within sample households. Compared to the level of the 1980 decennial census overall CPS undercoverage is about 7 percent. CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. As described previously, ratio estimation to independent age-sex-race-Hispanic population controls partially corrects for the bias due to undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age-sex-race-Hispanic group. Further, the independent population controls have not been adjusted for undercoverage in the 1980 census.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey,* Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology,* Bureau of the Census, U.S. Department of Commerce.

Sampling variability. Sampling variability is variation that occurred by chance because a sample was surveyed rather than the entire population. Standard errors, as calculated by methods described later in "Standard Errors and Their Use," are primarily measures of sampling variability, although they may include some nonsampling error. The sample estimate and its standard error enable one to construct a confidence interval, a range that would include the average result of all possible samples with a known probability. For example, if all possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples.

Some statements in the report may contain estimates followed by a number in parentheses. This number can be added to and subtracted from the estimate to calculate upper and lower bounds of the 90-percent confidence interval. For example, if a statement contains the phrase "grew by 1.7 percent (± 1.0)," the 90-percent confidence interval for the estimate, 1.7 percent, is 0.7 percent to 2.7 percent.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis appearing in this report is that the population parameters are different. An example of this would be comparing the local mobility rates for Blacks and Whites.

Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the characteristics are different when, in fact, they are the same. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better. This means that the absolute value of the estimated difference between characteristics is greater than or equal to 1.6 times the standard error of the difference.

Comparability of data. Data obtained from the CPS and other sources are not entirely comparable. This results from differences in interviewer training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Use caution when comparing results from different sources.

Caution should also be used when comparing estimates in this report, which reflect 1980 census-based population controls, with estimates for 1979 (from March 1980 CPS) and earlier years, which reflect 1970 census-based population controls. This change in population controls had relatively little impact on summary measures such as means, medians, and percent distributions, but did have a significant impact on levels. For example, use of 1980 based population controls results in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for data collected in 1981 and later will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain subpopulation groups than for the total population.

Since no independent population control totals for persons of Hispanic origin were used before 1985, compare Hispanic origin estimates over time cautiously.

Note when using small estimates. Summary measures (such as medians and percent distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, summary measures would probably not reveal useful information when computed on a smaller base. However, estimated numbers are shown even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates permit combinations of the categories to suit data users' needs. Take care in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Standard errors and their use. A number of approximations are required to derive, at a moderate cost, standard errors applicable to all the estimates in this report. Instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. Thus, the tables show levels of magnitude of standard errors rather than the precise standard errors.

The figures presented in tables B-1 and B-2 are approximations to the standard errors of various estimates for persons, families, households and unrelated individuals shown in this report. To obtain the approximate standard error for a specific characteristic, multiply the appropriate standard error in table B-1 or B-2 by the factor for that characteristic given in table B-3. These factors adjust the generalized standard errors for the combined effect of the sample design and the estimating procedure on the value of the characteristic.

Standard errors for intermediate values not shown in the generalized tables of standard errors (B-1 and B-2) may be approximated by linear interpolation.

Two parameters, a and b, are used to calculate standard errors for each type of characteristic; they are presented in table B-3. These parameters were used to calculate the standard errors in tables B-1 and B-2 and to calculate the factors in table B-3. They also may be used directly to calculate the standard errors for estimated numbers and percentages. The following sections give methods for computation.

Table B-1. **Standard Errors of Estimated Numbers of Movers Between March 1986 and March 1987**

(Numbers in thousands)

Size of estimate	Total or White	Black	Hispanic
10	8	8	8
25	13	13	13
50	18	18	18
75	22	22	22
100	26	26	26
250	41	41	41
500	58	57	57
750	71	70	69
1,000	82	80	79
2,500	128	123	119
5,000	180	164	154
7,500	219	188	168
10,000	251	201	166
15,000	303	202	110
20,000	344	168	(X)
25,000	379	46	(X)
30,000	408	(X)	(X)

Note: Multiply these standard errors by 1.5 for nonmetropolitan data.

Standard errors for decennial census data are small enough to ignore.

Standard errors of estimated numbers. There are two ways to compute the approximate standard error, s_x, of an estimated number shown in this report. The first uses the formula

$$s_x = fs \qquad (1)$$

where f is a factor from table B-3, and s is the standard error of the estimate obtained by interpolation from table B-1. The second method uses formula (2), from which the standard errors in table B-1 were calculated. This formula will provide more accurate results than formula (1).

$$s_x = \sqrt{ax^2 + bx} \qquad (2)$$

Here x is the size of the estimate and a and b are the parameters in table B-3 associated with the particular type of characteristic. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the factor or set of parameters for the characteristic which will give the largest standard error.

Table B-2. **Standard Errors of Estimated Percentages: Total, White, Black, and Hispanic**

Base (000)	Estimated percentage							
	1 or 99	2 or 98	5 or 95	10 or 90	20 or 80	25 or 75	35 or 65	50
10	8.1	11.4	17.8	24.5	32.7	35.4	39.0	40.9
25	5.2	7.2	11.3	15.5	20.7	22.4	24.7	25.9
50	3.6	5.1	8.0	11.0	14.6	15.8	17.4	18.3
75	3.0	4.2	6.5	9.0	11.9	12.9	14.2	14.9

Note: Multiply these standard errors by 1.5 for nonmetropolitan data.

Illustration of the computation of the standard error of an estimated number. Table A of this report shows that 43,693,000 persons moved between March 1986 and March 1987.

Using formula (1) with f = 1.0 from table B-3 and s = 468,000 by interpolation from table B-1 gives the approximate standard error of 468,000 = 1.0 x 468,000.

Using formula (2) with a = -0.000038 and b = 6,685 from table B-3, the approximate standard error is

$$\sqrt{(-0.000038)(43,693,000)^2 + (6,685)(43,693,000)} = 469,000$$

The 90-percent confidence interval for the number of persons who moved between March 1986 and March 1987 is from 42,943,000 to 44,443,000, i.e., 43,693,000 ± (1.6 x 469,000).

Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the base of the percentage. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factors or parameters from table B-3 indicated by the numerator. The approximate standard error, $s_{x,p}$, of an estimated percentage can be obtained by use of the formula

$$s_{x,p} = fs \qquad (3)$$

In this formula, f is the appropriate factor from table B-3 and s is the standard error of the estimate from table B-2.

Alternatively, formula (4) will provide more accurate results:

$$s_{x,p} = \sqrt{\frac{b}{x} p(100 - p)} \qquad (4)$$

Here x is the total number of persons or households which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table B-3 associated with the particular characteristic in the numerator of the percentage.

Illustration of the computation of the standard error of an estimated percentage. Suppose that of the 232,998,000 persons 1 year old and over, 1,200,000 or 0.5 percent moved from abroad between March 1986 and March 1987. Using formula (3), the appropriate factor from table B-3, (1.0), and interpolation from table B-2, the approximate standard error is 1.0x0.05 = 0.05 percent.

Table B-3. a and b Parameters and Factors (f) for Estimated Numbers and Percentages

Characteristic	Parameters		
	a	b	f

Marital status, household and family characteristics:			
Total or White:			
Families, householders or primary individuals	-0.000008	1,778	0.5
Some household members	-0.000021	4,480	0.8
All household members	-0.000025	5,444	0.9
Black:			
Families, householders or primary individuals	-0.000063	1,606	0.5
Some household members	-0.000254	6,426	1.0
All household members	-0.000374	9,475	1.2
Hispanic:			
Families, householders or primary individuals	-0.000094	1,606	0.5
Some household members	-0.000376	6,426	1.0
All household members	-0.000555	9,475	1.2

Note: These parameters are to be used for all of 1984 through 1987 data. To obtain standard errors for the 1950's, 1960's and 1970-71 through 1982-83 data, multiply the above parameters by the factors 2.01, 1.34 and 0.89, respectively. For 1983-84 data, use the parameters in P-20, No. 407, *Geographical Mobility: March 1983 to March 1984*.

Use the parameters as they appear in this table for metropolitan data but multiply them by 1.5 for nonmetropolitan data.

Using formula (4) the standard error of the percentage of persons who moved from abroad between March 1986 and March 1987 is

$$\sqrt{\frac{6,685}{232,998,000}\ 0.5\ (100.0-0.5)} = 0.04 \text{ percent}$$

This means that the 90-percent confidence interval for the percentage of persons who moved from abroad between March 1986 and March 1987 is from 0.4 to 0.6 percent, i.e., 0.5 ± (1.6 x 0.04).

Standard error of a difference. The standard error of the difference between two sample estimates is approximately equal to

$$s_{x-y} = \sqrt{s_x^2 + s_y^2} \qquad (5)$$

where s_x and s_y are the standard errors of the estimates x and y, respectively. The estimates can be numbers, percentages, ratios, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration of the computation of the standard error of a difference between estimates. Table A of this report shows that 43,693,000 persons moved between March 1986 and March 1987 (x), while 43,237,000 persons moved between March 1985 and March 1986 (y). The apparent difference between x and y is approximately 456,000 persons.

As mentioned before, the approximate standard error of the estimated 43,693,000 movers is 469,000. Similarly, the approximate standard error of the estimated number who moved between March 1985 and March 1986 is 467,000.

Using formula (5) the approximate standard error of the estimated difference between x and y is

$$s_{x-y} = \sqrt{(469{,}000)^2 + (467{,}000)^2} = 662{,}000$$

This means that the 90-percent confidence interval for the difference between the movers between March 1986 and March 1987 and the movers between March 1985 and March 1986 is from -603,000 to 1,515,000, i.e., 456,000 ± (1.6 x 662,000). Since this interval contains zero, we cannot conclude with 90-percent confidence that between March 1986 and March 1987 there were fewer people who moved than between March 1985 and March 1986.

Standard error of a mean for grouped data. The formula used to estimate the standard error of a mean for grouped data is

$$s_{\bar{x}} = \sqrt{(b/y)S^2} \qquad (6)$$

In this formula, y is the size of the base of the distribution and b is a parameter from table B-3. The variance, S^2, is given by the following formula:

$$S^2 = \sum_{i=1}^{c} p_i \bar{x}_i - \bar{x}^2 \qquad (7)$$

Here $\bar{x}$, the mean of the distribution, is estimated by

$$\bar{x} = \sum_{i=1}^{c} p_i \bar{x}_i \qquad (8)$$

c is the number of groups; i indicates a specific group, thus taking on values 1 through c.

p_i is the estimated proportion of households, families or persons whose values, for the characteristic (x-values) being considered, fall in group i.

$\bar{x}_i$ is $(Z_{i-1} + Z_i)/2$ where Z_{i-1} and Z_i are the lower and upper interval boundaries, respectively, for group i. $\bar{x}_i$ is assumed to be the most representative value for the characteristic for households, families or persons in group i. Group c is openended, i.e., no upper interval boundary exists. For this group the approximate average value is

$$\bar{x}_c = \frac{3}{2} Z_{c-1} \qquad (9)$$

Standard error of a ratio. Certain estimates may be calculated as the ratio of two numbers. The number of persons per household or the number of divorced persons per thousand married persons are examples.

The standard error of a ratio, x/y, may be calculated using

$$s_{x/y} = \frac{x}{y}\sqrt{\left(\frac{s_x}{x}\right)^2 + \left(\frac{s_y}{y}\right)^2 - 2r\left(\frac{s_x}{x}\right)\left(\frac{s_y}{y}\right)} \qquad (10)$$

The standard error of the numerator, s_x, and that of the denominator, s_y, may be calculated using formula (2) or, alternatively, formula (1) and table B-3; r represents the correlation between x and y.

For one type of ratio, the denominator is a count of families or households and the numerator is a count of persons in those households with a certain characteristic. If there is at least one person with the characteristic in every household, use 0.7 as an estimate of r.

For all other types of ratios r is assumed to be zero. If r is actually positive (negative), then this procedure will provide an overestimate (underestimate) of the standard error of the ratio.

NOTE: For estimates expressed as the ratio of x per 100 y or x per 1,000 y, multiply formula (10) by 100 or 1,000, respectively, to obtain the standard error.

Illustration of the computation of the standard error of a ratio. Table B shows that there were 641,000 male movers from abroad between March 1986 and March 1987 but only 501,000 females who moved from abroad. This means that the ratio of males to females among movers from abroad was 1.28. The standard error of this estimate is calculated by using the following steps:

Compute s_x and s_y using formula (2).

$$s_x = \sqrt{(-0.000032)(641{,}000)^2 + (3{,}309)(641{,}000)} = 46{,}000$$

$$s_y = \sqrt{(-0.000032)(501{,}000)^2 + (3{,}309)(501{,}000)} = 41{,}000$$

Compute $(s_x/x)^2 = 0.005150$ and $(s_y/y)^2 = 0.006697$.

Using formula (10) and $r = 0$, the estimate of the standard error is

$$s_{x/y} = (641{,}000/501{,}000)\sqrt{0.005150 + 0.006697} = 0.14$$

This means that the 90-percent confidence interval for the ratio of male to female movers from abroad is from about 1.06 to 1.50, i.e., 1.28 (1.6 x 0.14).

Standard error of a median. The sampling variability of an estimated median depends on the form of the distribution and the size of the base. One can approximate the reliability of an estimated median by determining a confidence interval about it. (See the section on sampling variability for a general discussion of confidence intervals.)

Estimate the 68-percent confidence limits of a median based on sample data using the following procedure.

1. Determine, using formula (4), the standard error of the estimate of 50 percent from the distribution.
2. Add to and subtract from 50 percent the standard error determined in step 1.
3. Using the distribution of the characteristic, determine upper and lower limits of the 68-percent confidence interval by calculating values corresponding to the two points established in step 2.

   Use the following formula to calculate the upper and lower limits.

$$X_{pN} = \frac{pN - N_1}{N_2 - N_1}(A_2 - A_1) + A_1 \qquad (11)$$

where

X_{pN} = estimated upper and lower bounds for the confidence interval ($0 \leq p \leq 1$). For purposes of calculating the confidence interval, p takes on the values determined in step 2. Note that X_{pN} estimates the median when $p = 0.50$.

N = *for distribution of numbers:* the total number of units (persons, households, etc.) for the characteristic in the distribution.

= *for distribution of percents:* the value 1.0.

p = the values obtained in step 2.

A_1, A_2 = the lower and upper bounds, respectively, of the interval containing X_{pN}.

N_1, N_2 = *for distribution of numbers:* the estimated number of units (persons, households, etc.) with values of the characteristic greater than or equal to A_1 and A_2, respectively.

= *for distribution of percents:* the estimated percent of units (persons, households, etc.) having values of the characteristic greater than or equal to A_1 and A_2, respectively.

4. Divide the difference between the two points determined in step 3 by two to obtain the standard error of the median.

Illustration of the computation of a confidence interval and standard error for a median. Suppose the median age of persons who moved within the same state between March 1986 and March 1987 is 26.5 years and that the base of the distribution from which the median was determined is 8,665,000 persons.

1. Using formula (4) with b = 6,685 from table B-3, the standard error of 50 percent on a base of 8,665,000 is

$$\sqrt{\frac{6{,}685}{8{,}665{,}000}(50.0)(100.0 - 50.0)} = 1.4 \text{ percent}$$

2. To obtain a 68-percent confidence interval, add to and subtract from 50 percent the standard error found in step 1. This yields percentage limits of 48.6 and 51.4.
3. Suppose the estimated numbers of movers within the same state, at least 25 or at least 30 years old, are 4,798,000 and 3,282,000 respectively. These estimates correspond to 55.4 and 37.9. Thus, the confidence interval around the median falls entirely within these ages.

   Using formula (11), the lower limit for the confidence interval of the median is found to be about

$$\frac{(0.514)(8{,}665{,}000) - 4{,}798{,}000}{3{,}282{,}000 - 4{,}798{,}000}(30-25) + 25 = 26.1 \text{ years}$$

Similarly, the upper limit is found to be about

$$\frac{(0.486)(8{,}665{,}000) - 4{,}798{,}000}{3{,}282{,}000 - 4{,}798{,}00}(30\text{-}25) + 25 = 26.9 \text{ years}$$

Thus, the 68-percent confidence interval for the median age of persons who moved within the same state between March 1986 and March 1987 is from 26.1 to 26.9 years.

4. The standard error of the median age is, therefore,

$$\frac{26.9-26.1}{2} = 0.4 \text{ years}$$

1987
Census of Agriculture

Results available beginning in the fall of 1988. Statistical data available for all counties, states, and the United States.

Data Include:

- Number of farms
- Land in farms
- Operator characteristics
- Type of organization
- Land use
- Size of farms
- Market value of agricultural products sold
- Livestock
- Poultry
- Poultry and livestock products
- Crops harvested
- Energy costs
- Production expenditures

Results Available in:

- Published Reports
- Computer Tapes
- Compact Disc-Read Only Memory (CD-ROM)
- Diskettes
